Check Palindrome by Filtering Non-Letters

Given a string containing letters, digits, and symbols, determine if it reads the same forwards and backwards when considering only alphabetic characters (case-insensitive).

Example

Input

code = A1b2B!a

Output

1

Explanation

- Step 1: Extract only letters -> ['A','b','B','a']

- Step 2: Convert to lowercase -> ['a','b','b','a']

- Step 3: Compare sequence forward and backward: 'abba' == 'abba' -> true

Input Format

A string code containing letters (A—Z, a—z), digits (0—9), and symbols

Constraints

0 <= code.length <= 1000

For all 0 <= i < code.length: 33 <= ASCII[code[i]] <= 126

code contains only printable ASCII characters (letters, digits, symbols)

Output Format

Return a boolean value: 1 if true & 0 if false.

Sample Input 0

Z

Sample Output 0

1

Sample Input 1

abc123cba

Sample Output 1

1

Language

Python 3

1

> #!/bin/python3--

12

Complete the 'isAlphabeticPalindrome' function below.

13

#

14

The function is expected to return a BOOLEAN.

15

The function accepts STRING code as parameter.

16

#

17

18

def isAlphabeticPalindrome(code):

19

20

> if __name__ == '__main__':--

Ln 10, Col 1

Autocomplete

Spaces: 4

Mode: Normal
